

Input columns are used by the transform to generate parsed, standardized, and cleansed output. To map an input column, click and drag it from the input schema area to the appropriate field in the Input tab. Columns for which a mapping type have been identified are mapped automatically.

Output columns contain parsed, standardized, and cleansed data from the transform. To map a column to the output scheme, select the check box on the Output tab. To replace an existing field with the new data, drag the column from the Output tab to the column in the output schema area and select Remap Column from the context menu.

**LESSON SUMMARY**

You should now be able to:

- Transform data
